

Okanagan ICF

AcuBuck

After working 20+ years in the ICF construction industry, Gorilla Buck (Patent Pending) decided there must be an easier way to deal with the ICF buck component and its attendant issues: water and air leaks, warping, hassles of strapping inside and outside of the typical wood buck frame. Not to mention the onsite custom cutting of lumber to match ICF wall thickness.

They developed their own buck product line to provide builders, contractors and homeowners with an easy to install, cost effective and competitively priced system designed to save you the headaches we experience ourselves. AcuTruss Industries believe Gorilla Buck have achieved this and have the perfect solution! Whether you're an architect wanting to match an existing ICF wall spec on a door, sill and walkout buck; a contractor looking to reduce labor and material costs on a project, or a homeowner looking for a high quality, easy to install green building product line.

Great value for your investment: AcuBuck, ICF Window & Door Buck system is the right choice.

Utilizing superior EPS in tandem with treated plywood, generally recommended for areas within 6" of grade, such as walkouts, door and sill applications on the weather facing sides of homes, use it anywhere resistance to moisture or humidity is desired. In certain climates and conditions, treated wood is recommended or required by local building codes to protect against decay, fungi, termites, carpenter ants or other wood destroying insects. The ¾" plywood buck adds insulation to window and door frames to match the super energy efficiency of the ICF wall. No warping, twisting, or separation.

Superb insulating qualities. Made to your specifications and available locally.
